

# Green PI for Digital Transformation

Control your digital transformation thanks to Green PI, a secure digital sandbox infrastructure dedicated to IoT discovery.

Green PI is an edge platform deployable on the fly to test all innovations (IoT) before integrating them into your IT environment through the creation of a confined, secure, and autonomous digital sandbox infrastructure.

## Digital Transformation

is vital for all companies and requires an increasing use of IoT. Each device used widens the surface of vulnerability for an attack. With 1.5 billion cyberattacks against IoT globally in 2021 alone and the increasing number of IoT used, companies worldwide are easier targets for cybercriminals regardless of their protections.

It is therefore crucial to be able to stay at the forefront (test all the new features and essential solutions) while protecting the company's IS against cyberattacks (which costs  $\approx$  12 million/year and leads to a shutdown  $\approx$  3 to 7 weeks).

**Industries: Finance, Energy, Health, insurance, SMEs/VSEs, Public Administrations, etc.**

## IoT

A set of IoE platforms to form a confined network (with the possibility of a secure gateway to Internet).

1 IoE platform = 300 m<sup>2</sup>

Access to Green PI's native services: visualization, location, file sharing, IoT management, blockchain...

## Multi-sites

Secure interconnection of several sites: production sites, offices, remote access.

Dedicated Internet gateways, security tunnels, etc.

## Maintenance

Maintenance subscription:

- Access to software updates;
- Technical Support.

**IoT: Internet of Things**  
**IoE: Internet of Edges**
